

INTRODUCTION:

Overview:

First of all I have downloaded a csv file from the Tableau website that consists of the data set information which consists of the details related to the Tank Ponds Ooranis in the Corporation Municipal and other areas. Then I have linked the Excel sheet to the Tableau software and created the different worksheets.

We can get a detailed clarity about the information in the form of the pictorial representation.

Purpose:

In the worksheets, the graphs are designed to show how the details present in the excel sheet are related to each other. The close relationship between the worksheets are shown in the form of Dashboards. And at last I have created the story telling to give the detailed explanation of individual worksheets.

The main agenda of this software is to create different types of graphs based on the information provided. We can achieve the graphical representation with the help of the information provided in the form of the excel sheet.

LITERATURE SURVEY:

Existing problem:

The data that is mentioned in the excel sheet cannot be understood. By just looking the dataset we can't analyze the situation.

Proposed Solution:

With the help of using the tableau software we can show the excel sheet information in the form of different type of graph so that it can be easily understood by anyone. We can easily know the relationship between each and every data set that was provided in the excel sheet.

Number of tanks based on type of the regions

THEORITICAL ANALYSIS:

Software Requirements of the project:

1. Tableau Desktop
2. Microsoft Excel

RESULT:

Total count of regions based on Municipalities and Corporations

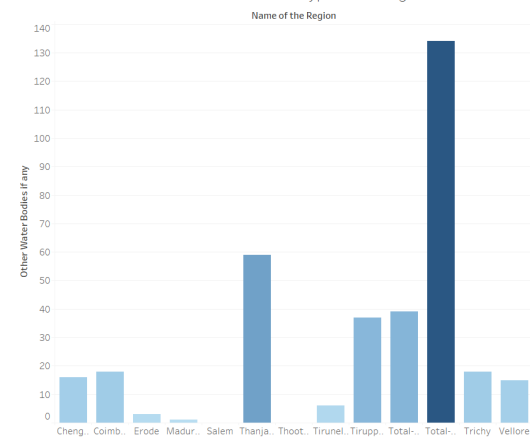

Number of tanks based on type of the regions

Number of Ooranis based on type of the regions

Number of other water bodies based on type of the regions

SPS-10540-Water & Sanitization

Total number of water bodies

Number of tanks based on the type

Number of ponds based on type of the regions

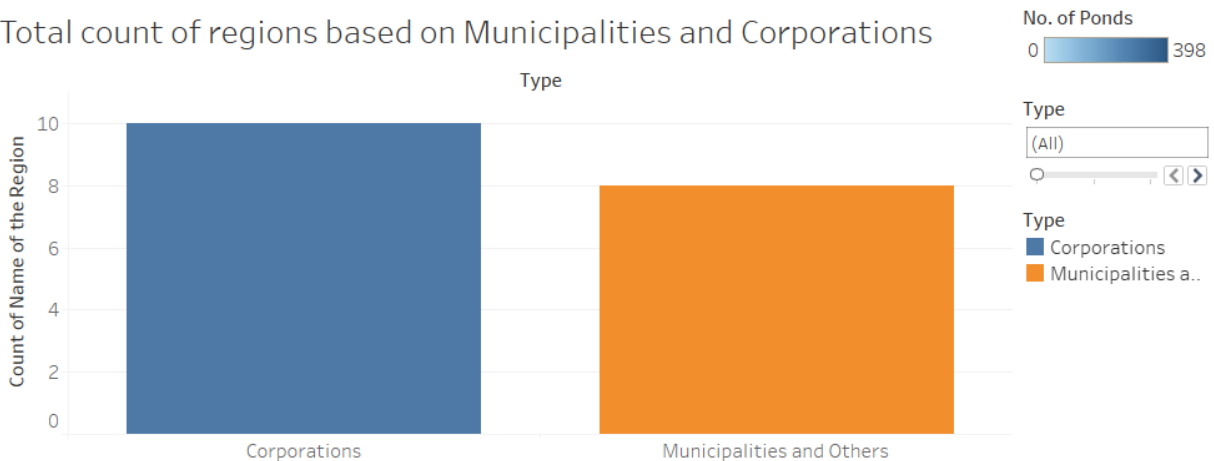

Total number of water bodies bades on survey records

Dashboard:

Total count of regions based on Municipalities and Corporations

Number of ponds based on type of the regions

Advantages:

- 1.Any type of data that is present in the excel sheet can be shown in a understandable way.
- 2.With the help of drag and drop we can easily include the information into the graph representation.

3. So many filters are available in the tableau software to show the graph in a colourful way.
4. The water bodies are divided into different categories and we can clearly understand the relationship between them.
5. The excel sheet may contain any amount of data that indicates that tableau supports processing the huge amount of data.

Disadvantages:

1. Adding huge amount of data leads to the Breakage.
2. The tableau will not be used for the complex calculations.
3. It cannot store variables.

Applications:

1. Data blending
2. Query translation into visualization
3. To create no-code data queries
4. To manage large size metadata

CONCLUSION:

Summerization:

1. The sheet consists of two main categories they are municipalities and corporations.
2. So many regions are comes under these two categories and some regions comes under both.
3. The corporations consists of more regions compared to the municipalities.
4. In each worksheet the one set of data will be compared with other.
5. The output will be shown graphical representation.
6. From this observation I have concluded that there are 117 ponds in Thanjavur that comes under the municipalities and others.
7. And there are 547 tanks in Thanjavur that comes under the municipalities and others.

FUTURE SCOPE:

Enhancements can be done in the future. Even any of the water bodies are increased or decreased the data must be updated to show the pictorial representation based on the changes.
